Attn: Charles Homfield, Facility Manager, Specialist  
9200 Powder Mill Road  
Laurel, MD 20708

Dear Mr. Homfield:

On September 16, 2003, Forest Service personnel conducted a gypsy moth egg mass survey at James J. Rowley Training Center (JJRTC). The purpose of this survey was to evaluate the efficacy of the suppression project conducted this past Spring and to assess the potential for defoliation and the need for treatment in 2004.

The location of the survey plots are shown in Figure 1. In brief, no new egg masses were detected at any of the 13 plots. No defoliation was detected at JJRTC during the aerial detection survey conducted on June 16 (see report dated July 15).

It was not expected that a suppression project using the biological insecticide Gypchek would provide 100 percent foliage protection and a 100 percent gypsy moth population reduction. Based on results of previous suppression projects using Gypchek, foliage protection was expected on approximately 75 percent of the treatment area along with a gypsy moth population reduction in the 50-75 percent range. It is very likely that the results of this year's suppression project was aided by a natural decline of the gypsy moth in the area.

Since no noticeable defoliation is expected, treatment is not recommended in 2004 at JJRTC.

Also for your information, no egg masses were found at the other adjacent federal sites.

Please call me at (304) 285-1555 if you have any questions regarding the egg mass survey or this letter.

Sincerely,

RODNEY L. WHITEMAN
